**Q1**

	<b>ANSWER</b>	<b>NOTES</b>
<b>a</b>	Letter: B  Name: (Volumetric) Pipette	A pipette can measure the stated volume of solution most accurately.
<b>b</b>		
<b>(i)</b>	Burette	
<b>(ii)</b>	In aqueous Ammonia: Yellow /Orange  In dilute Sulfuric acid: Red / Pink	
<b>c</b>	<p>Add 50 cm<sup>3</sup> of 0.100 mol/dm<sup>3</sup> aqueous ammonia to a clean beaker using a burette / pipette.</p> <p>Add 25 cm<sup>3</sup> of 0.100 mol/dm<sup>3</sup> sulfuric acid to the same beaker from a burette.</p> <p>Stir well using a clean glass rod.</p> <p>Heat the beaker to evaporate the water from the solution till it becomes saturated (some solid appears on the inner sides of the beaker).</p> <p>Allow the beaker to cool for crystals to form.</p> <p>Dry crystals by pressing between (dry) filter papers.</p>	<p>Candidates can choose any other suitable volume of Ammonia. The volume of Sulfuric acid must always be half of that of Ammonia.</p> $\text{H}_2\text{SO}_4(\text{aq}) + 2\text{NH}_3(\text{aq}) \rightarrow (\text{NH}_4)_2\text{SO}_4(\text{aq})$

Q1		
	ANSWER	NOTES
<b>d</b>		
<b>(i)</b>	35 cm <sup>3</sup>	
<b>(ii)</b>	<ul style="list-style-type: none"><li>the damp blue litmus paper: no change in colour (stays blue)</li><li>the damp red litmus paper: changes to blue</li></ul>	Ammonia is a (weakly) basic gas. It therefore turns damp red litmus blue.

Q2		
	ANSWER	NOTES
<b>a</b> <b>(i)</b>		
<b>(ii)</b>	450 s	
<b>b</b> <b>(i)</b>	Experiment 5 is repeated.	
<b>(ii)</b>	The point for 5 seems anomalous. It does not follow the general data trend. It is therefore repeated to increase the reliability of the data set.	
<b>c</b>	The more the mass of NaCl the faster the rate of rusting.	
<b>d</b>	<p><b>Effect:</b> The time for the blue colour to appear increases.</p> <p><b>Explanation:</b> The paint excludes Oxygen / water. It acts as a barrier between the iron and Oxygen / Water.</p>	
<b>e</b> <b>(i)</b>	<p>Different students see the blue colour differently. As a result, they record different times.</p> <p>Different times could also result from use of stopwatch. Different students may use the stopwatch differently.</p>	<p>Perception of colour differs from one individual to another.</p> <p>Differences could also arise from the use of stopwatch. Some students are more accurate in timing the appearance of blue colour using the stopwatch than others.</p> <p>This gives rise to random errors.</p>

## Q2

## continued from previous page

	ANSWER	NOTES
e (ii)	The trend does not change as the same masses of NaCl are used by each student. The systematic errors that affect the masses remain the same.

## Q3

	ANSWER	NOTES																				
a	<p>A = ethanol</p> <p>B = hexene</p> <p>C = ethanoic acid</p>	<p>The mixture turns from orange to colourless with B → positive result for an unsaturated hydrocarbon / alkene. B is hexene.</p> <p>Solid Calcium carbonate can react with Ethanoic acid to form Calcium ethanoate and carbon dioxide gas. It does not react with Ethanol and hexene. Liquid C is therefore Ethanoic acid.</p> <p>Liquid A must be Ethanol.</p>																				
b	↓																					
	<table border="1"> <thead> <tr> <th rowspan="2">Reagent</th> <th colspan="3">Observations</th> </tr> <tr> <th>A</th> <th>B</th> <th>C</th> </tr> </thead> <tbody> <tr> <td>Add bromine solution</td> <td><b>The mixture remains orange / stays the same / has no visible change</b></td> <td>The mixture turns from orange to colourless</td> <td>The mixture remains orange</td> </tr> <tr> <td>Add solid calcium carbonate</td> <td>No visible change</td> <td>No visible change</td> <td><b>Effervescence / bubbles / fizzing / calcium carbonate dissolves / disappears</b></td> </tr> <tr> <td>Add dilute sulfuric acid and a few drops of potassium manganate (VII)</td> <td><b>The mixture turns (from purple) to colourless / decolourises</b></td> <td>The mixture turns from purple to colourless</td> <td>The mixture remains purple</td> </tr> </tbody> </table>			Reagent	Observations			A	B	C	Add bromine solution	<b>The mixture remains orange / stays the same / has no visible change</b>	The mixture turns from orange to colourless	The mixture remains orange	Add solid calcium carbonate	No visible change	No visible change	<b>Effervescence / bubbles / fizzing / calcium carbonate dissolves / disappears</b>	Add dilute sulfuric acid and a few drops of potassium manganate (VII)	<b>The mixture turns (from purple) to colourless / decolourises</b>	The mixture turns from purple to colourless	The mixture remains purple
Reagent	Observations																					
	A	B	C																			
Add bromine solution	<b>The mixture remains orange / stays the same / has no visible change</b>	The mixture turns from orange to colourless	The mixture remains orange																			
Add solid calcium carbonate	No visible change	No visible change	<b>Effervescence / bubbles / fizzing / calcium carbonate dissolves / disappears</b>																			
Add dilute sulfuric acid and a few drops of potassium manganate (VII)	<b>The mixture turns (from purple) to colourless / decolourises</b>	The mixture turns from purple to colourless	The mixture remains purple																			
c (i)	<p>The student mixes liquids A and C. (Ethanol and Ethanoic acid)</p>	<p>Ethanol + Ethanoic acid → Ethyl ethanoate + Water</p> <p>Ethyl ethanoate is an ester. Esters are sweet smelling liquids.</p>																				

## Q3

(continued from previous page)

	ANSWER	NOTES
<b>c</b> <b>(ii)</b>	<p><b>Precaution:</b> The student should wear safety goggles, enclosed footwear, laboratory coat, and rubber gloves.</p> <p><b>Reason:</b> Concentrated Sulfuric acid is corrosive and can cause severe skin burns / potential eye damage.</p>	<p><b>Alternative answer:</b> The process required warming. Ethanol is a flammable liquid. The student should use a hotplate or water bath instead of warming directly using a Bunsen burner to prevent potential fire.</p>

**Q4**
**ANSWER**

↓

**NOTES**

White ppt. = Aluminium hydroxide  
 $\text{Al}(\text{OH})_3$  dissolves in excess of aq. NaOH but remains insoluble in excess of aq.  $\text{NH}_3$ .

Chloride ions react with Silver ions to form a white ppt. of Silver chloride.

The formation of a light blue ppt. which dissolves in excess of aq.  $\text{NH}_3$  is a positive result for Copper(II) ions.

Sulfate ions react with Barium ions to form a white ppt. of Barium sulfate.

Test	Observation	Pollutant ions present in sample
<b>M1</b> Add aqueous sodium hydroxide / NaOH(aq) / aqueous NaOH	white ppt., soluble in excess giving a colourless solution	$\text{Al}^{3+}$
Acidify with dilute nitric acid, then add aqueous silver nitrate	<b>M2</b> white ppt	$\text{Cl}^-$
Add aqueous ammonia	Light blue ppt., soluble in excess, giving a dark blue solution	<b>M3</b> $\text{Cu}^{2+}$
<b>M4</b> Aqueous barium chloride / aqueous $\text{BaCl}_2$ / aqueous barium nitrate / aqueous $\text{Ba}(\text{NO}_3)_2$ (1) <b>AND</b> Acid / Dilute nitric acid / aqueous $\text{HNO}_3$ or Dilute hydrochloric acid / aqueous $\text{HCl}$ (1)	<b>M5</b> white ppt	$\text{SO}_4^{2-}$

**Q5**

	ANSWER	NOTES																					
<b>a</b>	<p><b>Test:</b> The colourless liquid can be tested with anhydrous Copper(II) sulfate or with anhydrous Cobalt (II) chloride paper.</p> <p><b>Result:</b> Anhydrous Copper(II) sulfate changes colour from white to blue. Anhydrous Cobalt(II) chloride paper changes colour from blue to pink.</p>																						
<b>b</b>	The ice cools the vapour and condenses it (to water).																						
<b>c</b>	Carbon dioxide turns limewater milky.	Limewater is weakly alkaline while Carbon dioxide is an acidic gas. It reacts with limewater to form Calcium carbonate as a precipitate.																					
<b>d</b>	↓																						
<b>(i)</b>	<table border="1"> <tbody> <tr> <td>titration number</td> <td>1</td> <td>2</td> <td>3</td> </tr> <tr> <td>final reading</td> <td>24.9</td> <td>29.5</td> <td>38.8</td> </tr> <tr> <td>initial reading</td> <td>0.0</td> <td>5.2</td> <td>14.3</td> </tr> <tr> <td>volume of 1.00 mol / dm<sup>3</sup> HCl / cm<sup>3</sup></td> <td>24.9</td> <td>24.3</td> <td>24.5</td> </tr> <tr> <td>best titration results (✓)</td> <td></td> <td>✓</td> <td>✓</td> </tr> </tbody> </table>			titration number	1	2	3	final reading	24.9	29.5	38.8	initial reading	0.0	5.2	14.3	volume of 1.00 mol / dm <sup>3</sup> HCl / cm <sup>3</sup>	24.9	24.3	24.5	best titration results (✓)		✓	✓
titration number	1	2	3																				
final reading	24.9	29.5	38.8																				
initial reading	0.0	5.2	14.3																				
volume of 1.00 mol / dm <sup>3</sup> HCl / cm <sup>3</sup>	24.9	24.3	24.5																				
best titration results (✓)		✓	✓																				

Q5 (continued from previous page)		
	ANSWER	NOTES
<b>d</b> <b>(ii)</b>	average volume = $(24.3 + 24.5) \div 2$ = $24.4 \text{ cm}^3$	
<b>(iii)</b>	average volume = $24.4 \text{ cm}^3 = 0.0244 \text{ dm}^3$ $n(\text{HCl}) = 1.00 \times 0.0244 = 0.0244$	Number of moles, $n$ = Volume $\times$ Concentration
<b>(iv)</b>	$0.0244 \times 4 = 0.0976$	
<b>(v)</b>	Volume of NaOH = $100 \text{ cm}^3 = 0.100 \text{ dm}^3$ $n(\text{NaOH}) = 0.100 \times 2 = 0.200$	
<b>(vi)</b>	$0.200 - 0.0976 = 0.1024$ moles	
<b>(vii)</b>	<b>mole ratio</b> $1 \text{ CO}_2 : 2 \text{ NaOH}$ $\frac{1}{2} \text{ CO}_2 : 1 \text{ NaOH}$ $n(\text{CO}_2) = 0.1024 \div 2 = 0.0512$	
<b>(viii)</b>	$n(\text{hydrocarbon burnt})$ = $0.73 \div 86$ = $0.00849$ moles	$n = \text{mass} \div \text{molar mass } (M_r)$

**Q5**

(continued from previous page)

	ANSWER	NOTES
(ix)	$\frac{0.00849}{0.0512} = 6.03 \approx 6$ $n = 6$	<p><math>n</math> = number of moles of Carbon atoms in 1 mole of the alkane</p> <p>0.00849 moles of Hydrocarbon burn to produce 0.0512 moles of CO<sub>2</sub>.</p> <p>1 mole of Hydrocarbon burns to produce <math>\frac{0.00849}{0.0512}</math> moles of CO<sub>2</sub>.</p> $\frac{0.00849}{0.0512} = 6.03 \approx 6$ <p>Number of moles of CO<sub>2</sub> formed = number of moles of C present in 1 mol of the hydrocarbon</p> <p><math>n = 6</math></p> <p>The hydrocarbon is C<sub>6</sub>H<sub>14</sub> – hexane.</p>

BACK TO QUICK ACCESS GRID

[www.igcsechemistryanswers.com](http://www.igcsechemistryanswers.com)

**Q6**

	<b>ANSWER</b>	<b>NOTES</b>
<b>a</b>	0.38 0.76	The mass increases by 0.19 g for every 5 min increase in the time the current is passed.
<b>b</b>		
<b>(i)</b>	Pink-brown solid deposits on the cathode. The cathode appears bigger in size.	
<b>(ii)</b>	Copper ions from the electrolyte get discharged on the cathode forming metallic Copper.	
<b>c</b>	1.03 g	

## Q6

(continued from previous page)

	ANSWER	NOTES
<b>d</b>	Some of the Copper may not adhere to the cathode. It may fall off causing a decrease in mass.	
<b>e</b> <b>(i)</b>	The mass of anode decreases.	The Copper anode itself gets oxidised forming $\text{Cu}^{2+}$ ions which enter the solution.
<b>(ii)</b>	Initial mass of Anode = 4.00 g Decrease in mass of Anode after 15 minutes = 0.57 g Mass of Anode after 15 minutes = $4.00 - 0.57 = 3.43$ g	After 15 minutes: Increase in mass of cathode = decrease in mass of anode
